

LAYER

USES THE REAL MODEL?

Component tests — 269 cases, 44 s

parsing · routing · caching · grounding rules · safety bounds
fast and deterministic — generator is stubbed

no — stubbed

CI gate

Corpus sweep — 69 reports, 13 s

every report must retrieve itself · thresholds · determinism
catches silent corpus-wide regressions

no — retrieval only

CI gate

↑ cannot observe model behaviour · ↓ observes it directly

Behavioural suite — 16 cases, ~5 min

properties that survive sampling — never exact wording
a defect found by hand becomes a case in ~5 lines

yes

local gate

Concurrency probe — 8–12 requests, ~4 min

shared caches and index swap under simultaneous use
exposed queueing; confirmed the confidence ceiling fires

yes

local gate

Every defect that materially affected this system was a generation-behaviour defect.

None was reachable by the retrieval benchmark or by stubbed unit tests — which is why the lower two layers exist.
